

1850B Cordless Preemption Emitter

STROBECOM II

The model 1850B Cordless Emitter operates from a built-in light weight battery and gives you complete freedom of movement to test and study optical preemption system detector installations such as STROBECOM® or the 3M Opticom® system. It is fully compatible with both, and has a range of 1000 feet. It is available with an optional visible light filter which reduces the range approximately in half. The 1850B is rechargeable from 110VAC or 12VDC and can be recharged in the shop or in the vehicle. The 1850B is molded from high impact plastic and includes a pistol grip with a lockable trigger action switch to give you split second operation.

NOTICE:

The sale of this item is restricted to state and local governments and to authorized distributors only.
